PROJECT REPORT: SMART ASSIGNMENT SUBMISSION (SAS) SYSTEM

1. PROJECT OVERVIEW

The **Smart Assignment Submission (SAS)** is a web-based mobile application designed to streamline the process of submitting assignments and lecture notes for students at **Mbeya University of Science and Technology (MUST)**. The system focuses on ease of use, security, and persistent user sessions.

2. KEY FEATURES

- **User Registration**: Students can create accounts using their full three names and MUST registration numbers.
- **Secure Authentication**: A login system that validates credentials against stored user data.
- **Session Persistence**: The system uses localStorage to ensure users remain logged in even after closing the browser or restarting their device.
- **Assignment Management (CRUD)**:
    - **Create**: Students can upload new assignments and notes.
    - **Read**: Students can view their progress, grades, and upcoming deadlines.
- **Responsive Design**: The interface is optimized for mobile devices using CSS Flexbox and Media Queries.

3. TECHNICAL SPECIFICATIONS

- **Frontend**: HTML5, CSS3 (Gradients and Animations), and Vanilla JavaScript.
- **Data Storage**: Client-side storage via Web Storage API (localStorage).
- **Version Control**: Hosted on GitHub for collaborative tracking.

4. SECURITY & AUTHENTICATION

The system implements a security layer by:

1. Verifying the **Registration Number** and **Password** during login.
2. Using a unique session key:

$$Session = \{RegNo + Timestamp\}$$

3. Preventing unauthorized access to the dashboard by redirecting unauthenticated users back to the login page (index.html).

5. SYSTEM ARCHITECTURE

The application follows a modular frontend architecture:

- index.html: Entry point for authentication.
- register.html: Handles user onboarding and data creation.
- dashboard.html: The main interaction hub for uploading files and viewing grades.
- style.css: Centralized styling for a consistent User Interface (UI).

6. CONCLUSION

The SAS system successfully addresses the challenges of manual assignment tracking. It provides a robust, responsive, and secure platform for academic document management.
